

Dorchester Road & Oldfield Road Intersection Improvements Municipal Class Environmental Assessment Schedule 'B'

Public Information Centre Wednesday July 6th, 2022 5:00pm - 7:00pm

McBain Community Centre, Multi Purpose Room D/E, Second Floor 7150 Montrose Road, Niagara Falls, ON

Platinum member

ABOUT THE STUDY

The City of Niagara Falls is conducting a Municipal Class Environmental Assessment (MCEA) to identify the needs and opportunities for improvements at the intersection of Dorchester Road and Oldfield Road. Figure 1 illustrates the MCEA Study Area.

DEFINING THE PROBLEM:

The intersection of Dorchester Road and Oldfield Road is a three-legged intersection with an all-way stop control (AWSC) and experiences a typical daily traffic volume of approximately 3,000 vehicles (2021). Based on the findings of the transportation assessment for the intersection, traffic volumes are expected to increase significantly in the future due to planned development (Riverfront Community) and projected growth within the area. Under future traffic volumes, capacity issues and traffic delays are expected at the intersection with various traffic movements experiencing a failing Level of Service (LOS). Along with operational issues, the existing intersection lacks active transportation facilities and connectivity as well has an unconventional geometric layout.

Through the completion of this MCEA study, intersection alternatives have been developed and evaluated to improve future traffic operations, accommodate future development in the area, improve active transportation facilities and connectivity to existing and planned facilities, and continue to accommodate transit and large vehicles from the industrial properties to the southwest ensuring the safety of all road users.

This Public Information Centre (PIC) presents the Study process; existing conditions and key considerations/issues; description of alternative solutions; evaluation criteria and process; recommended preferred solution; and next steps in the MCEA process.

We invite you to share your comments and questions about the information presented. Feedback from the community and stakeholders will be considered in finalizing the evaluation and design of the preferred alternative. Please complete a comment sheet or contact one of the project team members identified on the Next Steps page to provide feedback.

Figure 1: MCEA Study Area

TIMELINE & PROCESS

The Municipal Class Environmental Assessment Planning and Design process (MCEA process) is used by municipalities to ensure that the requirements of the Environmental Assessment Act are met when undertaking capital works projects.

presented in the flow chart below.

We are here in the MCEA process

The Dorchester Road & Oldfield Road Intersection Improvements MCEA is being carried out as a Schedule B undertaking (Phases 1, 2 and 5) as

EXISTING CONDITIONS

The Study Area includes the intersection of Dorchester Road and Oldfield Road, located east of the QEW and Hydro Canal, south of McLeod Road (Regional Road 49) and north of the Welland River.

The intersection currently operates as an All-Way Stop Control (AWSC) with a 'Y' configuration consisting of north (Dorchester Road), southwest (Dorchester Road) and east (Oldfield Road) approaches. There are no active transportation (pedestrian or cyclist) facilities at the intersection.

The surrounding land use consists of mature residential subdivisions to the north, new residential subdivisions to the east and commercial/industrial to the southwest. A Hydro One corridor traverses north of the intersection.

KEY CONSIDERATIONS:

Several key considerations guided the development and evaluation of alternative solutions for the intersection, including:

- Future traffic operation
- Future development surrounding the Study Area
- Active transportation amenities (pedestrian and cyclists)
- Existing Right-of-Way (ROW) limits and property impacts
- Location of existing utilities
- Planned capital projects (Dorchester Road Reconstruction)
- Future trail projects (Millennium Trail and Fern Park Trail)

PROPOSED STUDY ALTERNATIVES:

Based on the Problem and Opportunity Statement and key considerations, proposed study alternatives for the intersection of Dorchester Road and Oldfield Road include:

- Alternative 1 Do Nothing

- Alternative 4 Roundabout

Several background studies have been completed to help characterize the Study Area and evaluate the proposed study alternatives, including:

- Transportation Assessment
- Archaeological Assessment
- Natural Environment Assessment

Alternative 2 – All-Way Stop Control (AWSC) with Geometric Improvements Alternative 3 – Signalized with Geometric Improvements

TRANSPORTATION ASSESSMENT

The purpose of the Transportation Assessment was to assess the existing and future traffic operation and impacts that the proposed study alternatives will have on the intersection of Dorchester Road and Oldfield Road.

Characteristics of the intersection of Dorchester Road and Oldfield Road include:

- Both Dorchester Road and Oldfield Road are classified as arterial roadways with two lanes of traffic
- Operates as an All-way stop control (AWSC)
- Serviced by City of Niagara Falls Transit
- Conventional on-road bike lanes exist on both sides of Oldfield Road only
- A sidewalk exists on the north side of Oldfield Road and on the west side of Dorchester Road (terminating approximately 60m from the intersection)
- Collision history is low with only six (6) collisions occurring over the last 5-years

EXISTING OPERATIONAL ASSESSMENT

For each of the study alternatives, under existing conditions (2021), the LOS for AM and PM peak times are:

Alternative	AM Peak
1 - Do Nothing (existing conditions)	А
2 - AWSC with Geometric Improvements	Α
3 - Signalized Intersection	A/B
4 - Roundabout	A

LOS	PM Peak LOS	
	A	
	A	
	A/B	
	A	

FUTURE OPERATIONAL ASSESSMENT

- and PM peak times for each of the study alternatives
- Community

2031

Alternative

- 1 Do Nothing (existing condition
- 2 AWSC with Geometric Improv
- 3 Signalized Intersection
- 4 Roundabout
- *Eastbound Left/Through Lane

2041

Alternative

- 1 Do Nothing (existing condition
- 2 AWSC with Geometric Improv
- 3 Signalized Intersection
- 4 Roundabout

*Eastbound Left/Through Lane

Level-of-Service (LOS) relates directly to average delays per vehicle with established LOS grades A through F, where A represents the highest level of service (least amount of delay) and F represents the lowest (unacceptable delays) – in general LOS A through D is acceptable, LOS E is cause for concern and F is unacceptable and triggers mitigating action.

The intersection was analyzed under future conditions (2031 and 2041) for both AM

Future conditions included anticipated volume associated with the Riverfront

ARCHAEOLOGICAL AND NATURAL ENVIRONMENT ASSESSMENTS

A Stage 1 Archaeological Assessment was completed for the Study Area. The Assessment determined that parts of the Study Area have been previously disturbed or assessed and do not retain archaeological potential. If the project limits extend into the green zone (map below) then a Stage 2 Archeological Assessment will be required.

STUDY AREA PHOTO LOCATION AND DIRECTION

DISTURBED - NO POTENTIAL

LOW/WET - NO POTENTIAL PREVIOUSLY ASSESSED - NO FURTHER WORK REQUIRED TEST PIT SURVEY REQUIRED

A Natural Environment Assessment was completed for the Study Area. The Assessment determined that a part of the Study Area is an evaluated provincial wetland. If the project limits extend into this area then further investigation and risk mitigation measures will be required. No Species at Risk (SAR) were identified within the Study Area.

LEGEND

D2-2: Green Ash Mineral Deciduous Swamp T2-9: Gray Dogwood Mineral Thicket Swamp Commercial and Institutional Residential

Throughout the MCEA process the following Alternative Solutions are being considered:

ALTERNATIVE 1: Do Nothing

- existing geometry and active transportation facilities to accommodate future development.
- This alternative is considered as a benchmark for comparison and required in all MCEA studies.

• Intersection of Dorchester Road and Oldfield Road remains in its existing condition. No opportunity to improve the

ALTERNATIVE 2: All-way Stop Control (AWSC) with Geometric Improvements

- Dorchester and Oldfield Road intersection will remain an all-way stop control (AWSC) intersection
- Geometric improvements to horizontal alignments to function as a T-intersection with better sightlines
- Inclusion of active transportation facilities (sidewalks, bike lanes and cross-walks)
- Addition of dedicated turn lanes to improve operation and LOS of turning movements

Advantages:

Improves visibility of the traffic control device for all movements

Provides crosswalk facility on north and southwest approach (Dorchester Road)

Sidewalk extension on north side of Oldfield Road improves pedestrian accessibility

Provides cyclist facilities on all approaches to tie into existing/proposed facilities

Pedestrian crossings are controlled

Provides dedicated turning lanes to minimize delay and improve operation of intersection

Less maintenance than traffic control signals

Lowest construction cost

No impact to surrounding property

Disadvantages:

Vehicle idling will affect air quality

No change in vehicle noise

Minor utility impacts

ALTERNATIVE 3: Signalized with Geometric Improvements

- Dorchester and Oldfield Road intersection will become signalized intersection
- Geometric improvements to horizontal alignments to function as a T-intersection with better sightlines
- Inclusion of active transportation facilities (sidewalks, bike lanes and cross-walks)
- Addition of dedicated turn lanes to improve operation and LOS of turning movements

Advantages:

Improves visibility of the traffic control device for all movements

Provides controlled pedestrian crossings

Provides crosswalk facility on north and southwest approaches (Dorchester Road)

Sidewalk extension on north side of Oldfield Road improves pedestrian accessibility

Provides cyclist facilities on all approaches to tie into existing/proposed facilities

Provides dedicated turning lanes to minimize delay and improve operation of intersection

No impact to surrounding property

Disadvantages:

Introduces minor delays to traffic during off peak hours

Vehicle idling will affect air quality

No change in vehicle noise levels

Will require signal maintenance

Minor utility impacts

ALTERNATIVE 4: Roundabout

- Dorchester and Oldfield Road intersection will become single lane roundabout
- Inclusion of active transportation facilities (sidewalks, bike lanes and cross-walks)

e single lane roundabout bike lanes and cross-walks

Advantages:

- Reduces approach speeds in all directions which facilitates improved gap acceptance resulting in improved capacities
- Eliminates potential left-turn conflicts
- Provides crossing facility at all approaches
- Shortest continuous crossing for pedestrians
- Roundabouts have been proven to reduce the frequency and severity of collisions
- Roundabouts operate with lower delays and shorter queues than other forms of control
- Creates an aesthetically pleasing focal point within a community
- Less maintenance than traffic signals
- Sidewalk extension on all approaches improves pedestrian accessibility
- Roundabout is designed to accommodate transport trucks and busses

Disadvantages:

- Highest construction cost alternative but lower life cycle cost than signals
- Roundabouts may be more challenging for pedestrian with vision impairment or mobility challenges
- Cyclists consideration requires off-road treatments further increasing construction costs, property and utility impacts
- May require public education and outreach prior to construction as roundabouts are still not a familiar form of traffic control for many drivers, cyclists, and pedestrians
- Significant utility impacts
- Requires land acquisition

PEDESTRIAN EXPERIENCES AT INTERSECTIONS

There are four (4) components of the pedestrian experience at intersections:

1) Statistical Level of Safety

3) Level of Accessibility

2) Feeling of Safety (Security)

4) Convenience

PEDESTRIAN SECURITY AT TRAFFIC SIGNALS

- of the pedestrian signals
- \bullet "safe" to cross
- \bullet
- \bullet

PEDESTRIAN SAFETY AT ROUNDABOUTS

- than traffic signals
- judge gaps and react to each other
- other
- The crossing distance for pedestrians is less
- instead of up at signals or left while turning right

Pedestrians often feel safer at intersections with traffic signals because

This feeling of safety (security) happens when the signals tell them it's

Most crashes involving pedestrians occur when drivers turn left or right across the crosswalk while the pedestrian has a Walk indication

There are a greater number of vehicle-pedestrian conflict points at a signalized/stop control intersection than at a roundabout

Statistically, roundabouts (especially single-lane) are safer for pedestrians

Traffic speeds are lower, giving pedestrians and drivers more time to

Roundabouts are designed to lower vehicle speeds as drivers approach, giving pedestrians and drivers more time to judge gaps and react to each

Pedestrians need only watch for traffic in one direction at a time

Drivers are more likely to be looking in the direction of pedestrians,

EVALUATING THE ALTERNATIVES

As part of the MCEA process, the developed alternatives are evaluated against a set of criteria to determine the preferred solution for the Study Area. The criteria that were used to evaluate the proposed alternatives are summarized below. The evaluation matrix summarizing the evaluation of each alternative is provided on the next display.

Evaluation Criteria	Weight	Performance Measure	
Vehicular Transportation	28%	 Anticipated traffic performance Impacts to existing and future traffic conditions Safety Compatibility and connectivity with the local road network Ability and need to accommodate planned developments 	
Active Transportation	28%	 Statistical level of safety Feeling of safety Level of Accessibility Compatibility and connectivity with the local road network Ability and need to accommodate planned developments 	<u>E\</u>
Natural Environment	5%	 Potential encroachment to designated natural areas Impacts to significant wildlife and their habitat, including Species at Risk (SAR) Impacts to vegetation communities Change in quantity and quality of stormwater runoff Impacts to air quality due to vehicle travel and congestion 	•
Socio-Economic Environment	10%	 Impacts to private properties and possible need for land acquisition Opportunity to improve urban design and streetscaping Potential for increase in traffic noise Opportunity to promote active transportation and healthy choices Impacts of construction on local road users 	M
Cultural Environment	4%	 Displacement or disruption of built and cultural heritage features or archaeological resources 	A.
Engineering/ Constructability	10%	 Impacts on existing utilities and need for utility relocation or implementation Key considerations for design and construction Future maintenance 	Le
Cost Consideration	15%	 Construction Capital costs City's operating costs 	

EVALUATION SCALE:

To provide an impartial, traceable and consistent evaluation, as required by the MCEA process, the following method was used to illustrate the highest and lowest impact of each alternative relative to the evaluation criteria.

The alternatives were evaluated against the seven (7) criteria using a five-point scale as summarized below, ranging from most desirable (50) to least desirable (10).

Rating	Numerical Rating	Colour Code
Most Desirable	50	
Better Choice	40	
Adequate Choice	30

NEXT STEPS

Once the preferred solution is confirmed and the MCEA study is finalized, the City will transition to design of the preferred solution, including:

- Develop detailed design of road works including streetscaping, signage and lighting;
- Develop detailed design of storm drainage modifications;
- Construction staging and review and recommendation including timing of works to determine anticipated construction schedule;
- Coordinate design requirements with regulatory agencies and obtain all necessary approvals and permits;
- Coordinate property easements/acquisitions (if required) to facilitate implementation of proposed works; and
- Coordinate relocation of utilities that are in conflict with proposed works, as required.

Following this PIC, the project team will:

- Integrate feedback received from the public and stakeholders;
- Confirm the Preferred Solution;
- Document the MCEA process including considerations for detailed design to be carried forward; and
- File the Project File Report for 30-day public review.
